

SAFE PRACTICES FOR MIXING PAINT

Wear gloves, paint suits, and respirators: this equipment protects you from very significant exposures to isocyanates and solvents

Use safe cleaners to wash your hands: if you get paint on your skin, don't clean it off with solvents! There are special cleaners for this purpose.

Provide adequate ventilation: a ventilated mixing area prevents the build up of paint and solvent vapors

Close all containers of painting materials immediately after their use: vapors of solvent and other organic chemicals will evaporate out of any open cans or containers
